

Human Papilloma-virus.

An injection to stop sickness. This is for year 7 girls and young fellas, all over the Northern Territory. If your child is away when they give the injection you can take them to the clinic for their needle.

Bring this form back to school after filling it in yes or no. if you are willing or not to have the injection.

What is this for?

This is for the sickness called Human Papilloma-virus. It is not for COVID

19. There are many viruses like this. They don't all make us sick. They just cause warts. But other viruses are very bad. They can give us dangerous warts and sores inside a girl's vagina, and on a boy or man's penis, in the arsehole and also on the head and neck. They can cause cancer and prevent having children. There is no cure for this sickness.

How do people become sick with this virus?

This virus is spread through sex. Many people don't become sick from this virus. Other people get a serious illness inside which later may become cancer.

About this vaccine:

It is good for young men and girls to have this injection so they don't get the sickness. If they all have the injection the virus will go away. If they have this injection before they start their married life it will work well to block the virus. Later when they become men and women they should still go to the clinic for health check-ups to make sure they are well. This injection is given several times in one year.

Possible side effects: How might they feel after the injection?

Their arm might feel a little bit sore, they might have a little swelling or redness around the place where the needle went in, just for a day or 2. Some might get a headache, some might feel sick in their stomach. If their arm is sore, put a cold damp cloth on it. If they get a headache, give them Panadol. They will have no serious illness from this injection.
